Elastomeric Pipe Connectors are

designed to relieve piping stress, reduce noise and vibrations and compensate for lateral and angular piping misalignment

End connections are reinforced rubber flanges with steel backing rings or steel reinforced bead ends with rotating flanges. Standard pressures of ANSI 150-300 psig.

Pipe connectors are designed for vibration, angular and lateral movement only. If there are axial forces acting on connectors, then use control units to restrict the pipe motion or use an expansion joint that is designed for axial

Spool, Concentric Reducing, Eccentric Reducing Elbows, Offsets, Oversize Flanges, Vacuum Rated, Dredging Sleeves.
